## Beta

We can use the base plot functions in R to create a plot of the pdf for a beta random variable  $X$  with parameters  $\alpha$  and  $\beta$ . Note that R defines  $\alpha = \text{shape1}$  and  $\beta = \text{shape2}$ .

```
x <- seq(0, 1, by=0.001)
plot(x, dbeta(x, shape1=0.5, shape2=0.5), lty=1, col=1, type="l", xlab="x", ylab="f(x)", ylim=c(0,3))
lines(x, dbeta(x, shape1=1, shape2=0.5), lty=2, col=2)
lines(x, dbeta(x, shape1=2, shape2=0.5), lty=3, col=3)
lines(x, dbeta(x, shape1=0.5, shape2=1), lty=4, col=4)
lines(x, dbeta(x, shape1=1, shape2=1), lty=5, col=5)
lines(x, dbeta(x, shape1=2, shape2=1), lty=6, col=6)
lines(x, dbeta(x, shape1=0.5, shape2=2), lty=7, col=7)
lines(x, dbeta(x, shape1=1, shape2=2), lty=8, col=8)
lines(x, dbeta(x, shape1=2, shape2=2), lty=9, col=9)
```

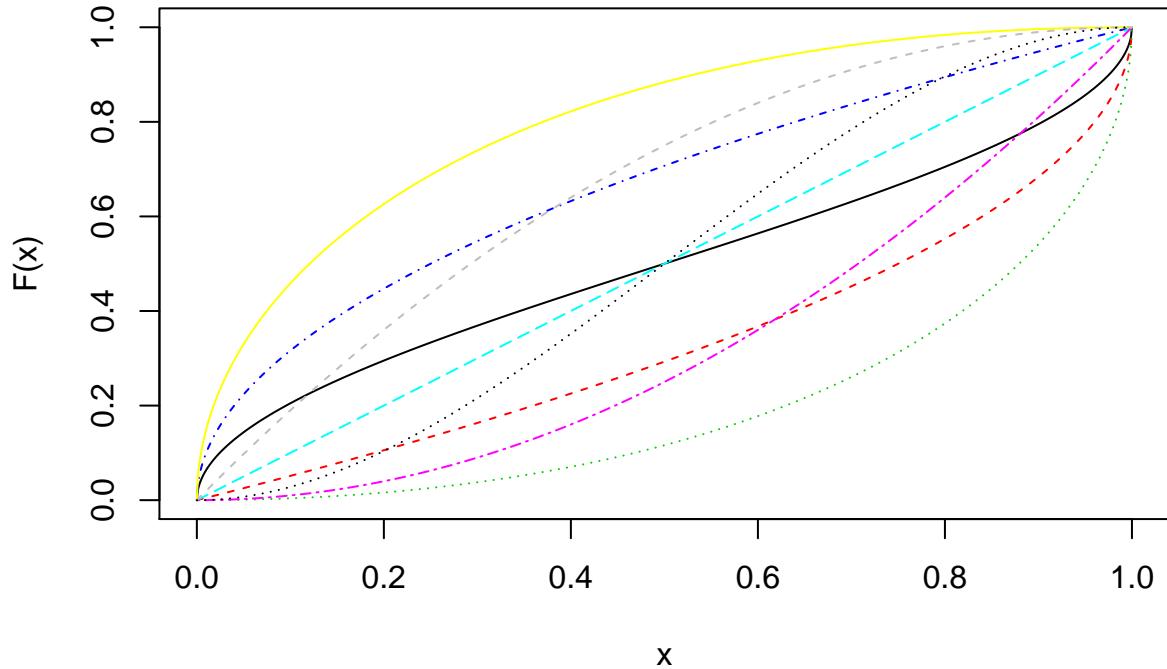

The CDF may be plotted analogously.

```
x <- seq(0, 1, by=0.001)
plot(x, pbeta(x, shape1=0.5, shape2=0.5), lty=1, col=1, type="l", xlab="x", ylab="F(x)")
lines(x, pbeta(x, shape1=1, shape2=0.5), lty=2, col=2)
lines(x, pbeta(x, shape1=2, shape2=0.5), lty=3, col=3)
```

```

lines(x, pbeta(x, shape1=0.5, shape2=1), lty=4, col=4)
lines(x, pbeta(x, shape1=1, shape2=1), lty=5, col=5)
lines(x, pbeta(x, shape1=2, shape2=1), lty=6, col=6)
lines(x, pbeta(x, shape1=0.5, shape2=2), lty=7, col=7)
lines(x, pbeta(x, shape1=1, shape2=2), lty=8, col=8)
lines(x, pbeta(x, shape1=2, shape2=2), lty=9, col=9)

```

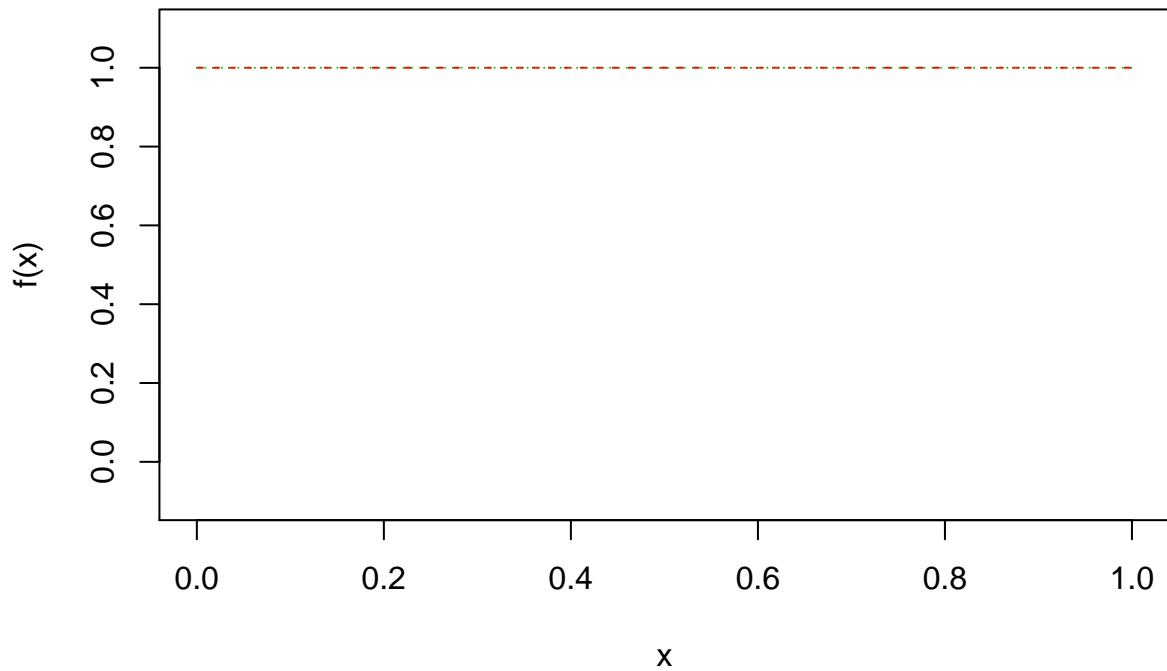

## Uniform

The special case of the beta(1,1) is actually a U(0,1). Interesting, but not very helpful.

```

x <- seq(0, 1, by=0.001)
plot(x, dbeta(x, shape1=1, shape2=1), lty=2, col=2, type="l", xlab="x", ylab="f(x)", ylim=c(-0.1,1.1))
lines(x, dunif(x, 0, 1), lty=3, col=3)

```

```
plot(x, pbeta(x, shape1=1, shape2=1), lty=2, col=2, type="l", xlab="x", ylab="F(x)")
lines(x, punif(x, 0, 1), lty=3, col=3)
```
